

How to install cocoapods in iOS

Open your terminal in MAC machine.

STEP 1 - `sudo gem install cocoapods`

STEP 2 - `cd` select your project location

STEP 3 - `touch podfile/pod init`

STEP 4 - `open -e podfile`

<https://cocoapods.org/>

Sample Projects from github

AmDots:

AMDots is a loading indicator with dots moving like google loading, there is three type of the loading, scale, jump and shake, each one of them gives you a cool loading to show to the user

Project 1 :

Cocoapods

<https://cocoapods.org/pods/AMDots>

Github

<https://github.com/Abedalkareem/AMDots>

CocoaControls

<https://www.cocoacontrols.com/controls/amdots>

Installation Guide

```
target 'MyApp' do
```

```
  pod 'AMDots', '~> 1.0'
```

```
end
```

Project 2 :

Alamofire is an HTTP networking library written in Swift.

Cocoapods

<https://cocoapods.org/pods/Alamofire>

Github

<https://github.com/Alamofire/Alamofire>

Installation Guide

```
target 'MyApp' do  
  
  pod 'Alamofire', '~> 4.7'  
  
end
```

STEP 5 - pod install

STEP 6 -Close your current Xcode project and open your current workspace project

What is workspace ?

The project contains multiple project that is called workspace.
